

If you're looking for an IDE (integrated development environment) that offers the ability to develop applications for Windows, Mac, and Linux operating systems, or if you want to create programs for C/C++ without having to learn C/C++ first - Embarcadero RAD Studio is your best choice. Delphi is the main component of RAD Studio. It offers a powerful IDE that is easy to use for beginners, but also contains the most advanced programming features for seasoned developers. Since Delphi has been around for nearly 20 years now, it is without any doubt one of the most mature IDEs available on the market. Add to that the fact that Embarcadero regularly releases updates with new features and you'll see why RAD Studio is considered by many developers as one of the best C++ IDE available today. As you can see in Figure 1, RAD Studio offers a very clean interface that allows you to navigate through all its different components easily - including Delphi, C++Builder, and Database tools (eXpress). The IDE has a very modern look to it. Its appearance is mostly flat, with chunky icons for common components grouped at the bottom of the screen. The tools are easy to find and once you get used to them, you won't have any trouble using them. Once you've chosen an object, control or other components you want to use in your application - RAD Studio allows you to drag and drop them into your design. If you need more precision or if you want to place the same component in different places in your program, then you can choose between auto layout mode, which ensures perfect positioning of objects on the screen without having any apparent gaps between them, or manual layout mode where placement of objects are calculated by the programmer himself. The choice between these two modes depends mainly on the complexity of your program and your experience level as a programmer. RAD Studio 10 offers lots of great features, such as: If you're an experienced Delphi or C++ Builder developer and you're looking to create applications for mobile devices like Android and iOS - then you'll probably know that each mobile device has its own set of APIs that you must use in order to create programs for those platforms. RAD Studio includes a powerful database called FMX which will enable you to create high performance database applications as well as websites with very little effort. The database tools are very easy to use, and in most cases you can pick up programming in C++ with FMX in less than an hour. The RAD Studio 10 integrated into your computer will give you access to a whole set of useful tools that enable you to easily create Delphi programs for the desktop computers, the web, mobile devices, and .NET server components. RAD Studio has many editions. These are the main differences between them:

Many people who have used RAD Studio have positive things to say about it. Here are some of the most common complaints made by users. "I'm glad this was not brought out when I wanted to switch from Apple to Delphi.
